## Cashflow Model

This plan has been prepared using your current financial position as a starting point which is then projected forward into the future using the planned income, expenditure, savings and investments. A number of different outcomes can be considered as part of the cashflow planning process representing different assumptions, expectations or choices you make in your planning.

Cashflow modelling is designed to illustrate the financial outcome(s) resulting from a specific set of choices and demonstrate if you have insufficient wealth to meet all of your objectives or that you have surplus wealth which continues to increase throughout your life. This information will help you make informed decisions about your future including reducing or increasing expenditure, changing your investment strategy or protecting your estate.

## Leave Savings in Building Society

You would like to know if you could make your money work harder as you are unsure if you can afford your financial aims and objectives by leaving your money in the building society.

Your current financial circumstances are as follows:

- $\mathrm{Mr} \times$ Amples is in receipt of a full state pension
- Mrs X Amples is in receipt of a part state pension
- Mr Examples has an indexed linked annuity in payment from an old private pension
- You have $£ 50,000$ in savings held at the Nicer Building Society

## Events modelled in this illustration:

- You would like to pay $£ 50$ per month to each of your 2 grandchildren's Child Trust Funds.
- You would like to spend $£ 5 \mathrm{k}$ per year on holidays over the next 10 years while you are fit enough to do so.
- Reflect everything planned where no unforeseen events occur
- You live to another 25 years to age 95

## Basic Information

| Illustration | 70 to 95 |
| :--- | :--- |
| State Pension Age | 65 |
| Inflation Rate | $1.8 \%$ per annum |
| Initial Cash | $£ 50000$ |
| Interest Rate | $1.3 \%$ per annum |

General assumptions:

- The validity of any projection or plan is only as good as the input assumptions and values used to create it
- Figures shown may fluctuate in reality and could have a significant positive or negative effect on your finances
- Regularly reviewing the cashflow reports and the assumptions used will increase the accuracy of the forecasted outcomes

## Income

|  | From | To | Amount | Frequency | Adjust |
| :--- | :--- | :--- | :--- | :--- | :--- |
| State Pension (Mr) | 70 | 95 | $£ 5700$ | Annually | By Inflation |
| State Pension (Mrs) | 70 | 95 | $£ 3500$ | Annually | By Inflation |
| Annuity (Mr) | 70 | 95 | $£ 3400$ | Annually | By Inflation |

## Spending

|  | From | To | Amount | Frequency | Adjust |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Living Expenses | 70 | 95 | $£ 12500$ | Annually | By Inflation |
| Holidays | 70 | 79 | $£ 5000$ | Annually | By Inflation |
| Gifts to Grandchildren | 70 | 74 | $£ 1200$ | Annually | No |

Assumptions about spending:

- The spending figures shown are based on your current spending habits today and cannot predict what you will actually spend at retirement

Cash - A summary of your opening and closing cash balances for each year is shown below.

| Age | Opening | Incomes | Spending | Investments | Closing |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{7 0}$ | 50000 | +12600 | -18700 | +650 | $=44550$ |
| $\mathbf{7 1}$ | 44550 | +12600 | -18678 | +579 | $=39051$ |

| 80 | 12500 | 0 | 0 | 12500 |
|  | Values repeating until |  |  |  |
| 95 | 12500 | 0 | 0 | 12500 |

Spending v Income - A comparison of spending versus income is shown below.

## Conclusion

The cashflow analysis confirms that based on the low rate of interest paid on your savings balance from the Nicer Building Society and your planned spending, your savings will be exhausted over the next 9 years when you reach age 79. You have stated that you do not wish to give up your holidays or your financial gifts to your grandchildren and your living expenses cannot be altered. Therefore the suggested action would be to make your savings work harder by considering investing part of your savings to generate a better return.

## Cashflow Model

## Invest Half Your savings

Due to the effects of inflation and the low interest rate being paid on your savings you are not able to meet all of your financial aims and objectives and will run out of money by age 79. You therefore want to consider investing some of your savings in order to increase the potential returns on what is invested.

Your current financial circumstances are unchanged from those set out in the initial scenario.

## Events modelled in this illustration:

- You would like to pay $£ 50$ per month to each of your 2 grandchildren's Child Trust Funds.
- You would like to spend $£ 5 \mathrm{k}$ per year on holidays over the next 10 years while you are fit enough to do so.
- Your investment returns achieve a $2 \%$ real rate of return after taking into account inflation.
- Reflect everything planned where no unforeseen events occur
- You live to another 25 years to age 95

## Basic Information

| Illustration | 70 to 95 |
| :--- | :--- |
| State Pension Age | 65 |
| Inflation Rate | $1.8 \%$ per annum |
| Initial Cash | $£ 25000$ |
| Interest Rate | $1.3 \%$ per annum |

## Investments

```
NISA }
Initial Value £12500
Capital Gain 4% pa
Income 3.8% pa Paid Out
        From To Activity
Withdraw funds 75 79 Withdraw £2450 Annually Amount adjusted by inflation
```

| NISA 2 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Initial Value | £12500 |  |  |  |
| Capital Gain | 4\% pa |  |  |  |
| Income | 3.8\% pa Paid Out |  |  |  |
|  | From | To | Activity |  |
| Withdraw funds | ds 75 | 79 | Withdraw $£ 2450$ Annually | Amount adjusted by inflation |

Assumptions about investments:

- A 4\% p.a. actual return is generated on your investments
- Funds equal to the difference between expenditure and income are withdrawn from your investments between age 75 and 79 inclusive.

Cash - A summary of your opening and closing cash balances for each year is shown below.

| Age | Opening | Incomes | Spending | Investments | Closing |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{7 0}$ | 25000 | +12600 | -18700 | +1275 | $=20175$ |
| $\mathbf{7 1}$ | 20175 | +12600 | -18678 | +1233 | $=15330$ |

| $\mathbf{9 5}$ | 3404 | 3404 | 6809 |

## Conclusion

The cashflow analysis confirms that by investing half of your savings balance in order to generate a greater return than is being paid on these, you can meet all your financial objectives without any negative implications on your cashflow. The rate of return shown is moderate and assumes a 4\% return on your investments. The lowest value of your investments would be $£ 4912$ at age 80 and then steadily rise again thereafter. Any greater figure achieved for return on investments would have a positive effect on your investment values.

## Appendix

## Personal Details

Client 1 is Mr X Amples date of birth 24 / 07 / 1945.

Client 2 is Mrs X Amples date of birth 01 / 08 / 1945.

## Today's Money

Where values are described as being in today's money that means that, whilst the nominal (actual) amounts in future years may have increased by inflation, the values shown have been discounted by inflation to show their real value in today's terms.

For example whilst loan repayments or level annuity income might be a fixed sum each year the actual value of that amount (its buying power) will be eroded by inflation and so in future years its value is smaller in today's money.

This is useful as it allows for valid comparison of values at different times. Often nominal amounts far in the future may seem to be very large because of the compounding effect of inflation, but when seen in today's money its real value can be better appreciated
